2000- **Founding Director, USC Chernobyl + Fukushima Research Initiative** – This research initiative began formal research activities in Ukraine in 2000, Belarus in 2005, and Fukushima, Japan, in July, 2011. To date, the group has conducted more than 40 research expeditions to Chernobyl and 18 expeditions to Fukushima. Original funding sources included the Samuel Freeman Charitable Trust, the CNRS (France), the National Science Foundation, and the National Geographic Society. Subsequently, additional funding sources have included NATO, the Civilian Research Development Foundation (CRDF), the National Institutes of Health (NIH), Qiagen GmbH, the Fulbright Foundation, the University of South Carolina Office of Research, the University of South Carolina College of Arts & Sciences, the Academy of Finland, and gifts from private citizens. To date, more than 80 scientific publications have resulted from this initiative, most in the past decade, with many others in progress. This research has been highlighted in many newspaper reports and television programs including the New York Times, The Economist, Harpers, the BBC, CNN, CBS’s 60 Minutes, Scientific American, and the PBS News Hour (see attached list). The team has pioneered the use of advanced ecological, genetic and dosimetric technologies in order to unravel the health and environmental consequences of chronic low-dose exposure resulting from the Chernobyl and Fukushima disasters. These have included massively replicated ecological censuses of natural populations of birds, mammals and insects to investigate population and demographic effects; DNA sequencing and genotoxicity testing to assess short and long term genetic damage to individuals living in the wild; and the development of miniature dosimeters attached to wild animals and field measurements of whole body burdens of radioisotopes in birds and mammals to obtain accurate estimates of realized external and internal radiation doses to animals living under natural conditions. Recently, the group has expanded to include epidemiological and genetic studies of human populations (especially children) living in Chernobyl-affected regions of Ukraine. USC’s Chernobyl + Fukushima Research Initiative was the first and currently is the only research group to utilize a multidisciplinary approach to address the health and environmental outcomes of radiation effects in free-living natural populations. This has permitted the investigation of both acute (short term) and chronic (long term and multi-generational) exposures. The Chernobyl + Fukushima Research Initiative is also currently the only independent research team working in both Chernobyl and Fukushima.

TEACHING EXPERIENCE

Since starting at USC in 1991, my formal teaching has alternated between BIOL 301 – Ecology and Evolution, a large required course for biology majors, and BIOL 652 – Evolutionary Genetics, a required course for incoming graduate students. I have also organized numerous graduate level seminar courses, and taught BIOL 270 – Environmental Science, on multiple occasions. Much of my non-classroom teaching has focused upon mentoring students in research.
